One ranked relief plan from conflicting reports.

POSEIDON is a human-supervised command centre that verifies, ranks, allocates and re-routes disaster relief. Every piece of evidence carries a reliability score from 0 to 1.

Try the scoring

Source: dataset/processed_data/district_impact.csv,
tagged PROVISIONAL.

Six steps, one loop, one human gate.

Language models read and explain. Deterministic maths decides, so every score can be audited and replayed.

Ten forwards of one rumour are not ten reports.

Number of public reports (0.45 each) **6**

Where they come from

Independent people

Noisy-OR fusion from the design report: C = 1 − ∏(1 − w·r). The first source counts in full (w = 1.0), each further copy counts 0.3.

0.97

Logged | Unverified watch | Probable | Confirmed

Confirmed

Eligible for full resource allocation.

Fair by design, not by luck.

Six measures, scored against a naive baseline.

A built-in simulator replays one scenario twice, with the baseline and with POSEIDON. The scenario is synthetic, so the comparison shows method behaviour, not real-world performance.

Built on real cyclone and flood records.

Every record carries a lineage tag: REAL, PROVISIONAL, DERIVED or SIMULATED. Synthetic demo records live in their own folder.
